

# Conditional propositions

- $p \rightarrow q$
- Read as: if  $p$ , then  $q$ 
  - $p$  implies  $q$
  - $p$  is a sufficient condition for  $q$
- If  $p$  is true,  $q$  must also be true
- If  $p$  is false, we have no information about  $q$   $p \rightarrow q$  true
- Examples:
  - If  $1 + 1 = 3$ , then the moon is made of cheese. True
  - If 9 is divisible by 3, 7 is not divisible by 3. True
  - If 9 is divisible by 3, all integers are even. False
  - If  $1 + 1 = 3$ , then  $2 + 3 = 5$ . True
- Note:  $p \rightarrow q \neq q \rightarrow p$

# Conditional propositions - equivalences

The following propositions are equivalent

- $p \rightarrow q$
- $\neg q \rightarrow \neg p$  *contra positive*
- $\neg p \vee q$

$p$	$q$	$p \rightarrow q$	$\neg q$	$\neg p$	$\neg q \rightarrow \neg p$	$\neg p \vee q$

# The biconditional

- $p \leftrightarrow q$

- Short for:  $(p \rightarrow q) \wedge (q \rightarrow p)$

- Read as:  $p$  is equivalent to  $q$   
 $p$  if and only if  $q$   
 $p$  iff  $q$

$p$  is a necessary and sufficient condition for  $q$

$p$	$q$	$p \rightarrow q$	$q \rightarrow p$	$p \leftrightarrow q$
